

Innovative road management system

نظام مبتكر لإدارة الطرقات

InfraDoctor®

A cutting-edge system for supporting infrastructure maintenance utilizing GIS and 3D point cloud data

Mobile Mapping System

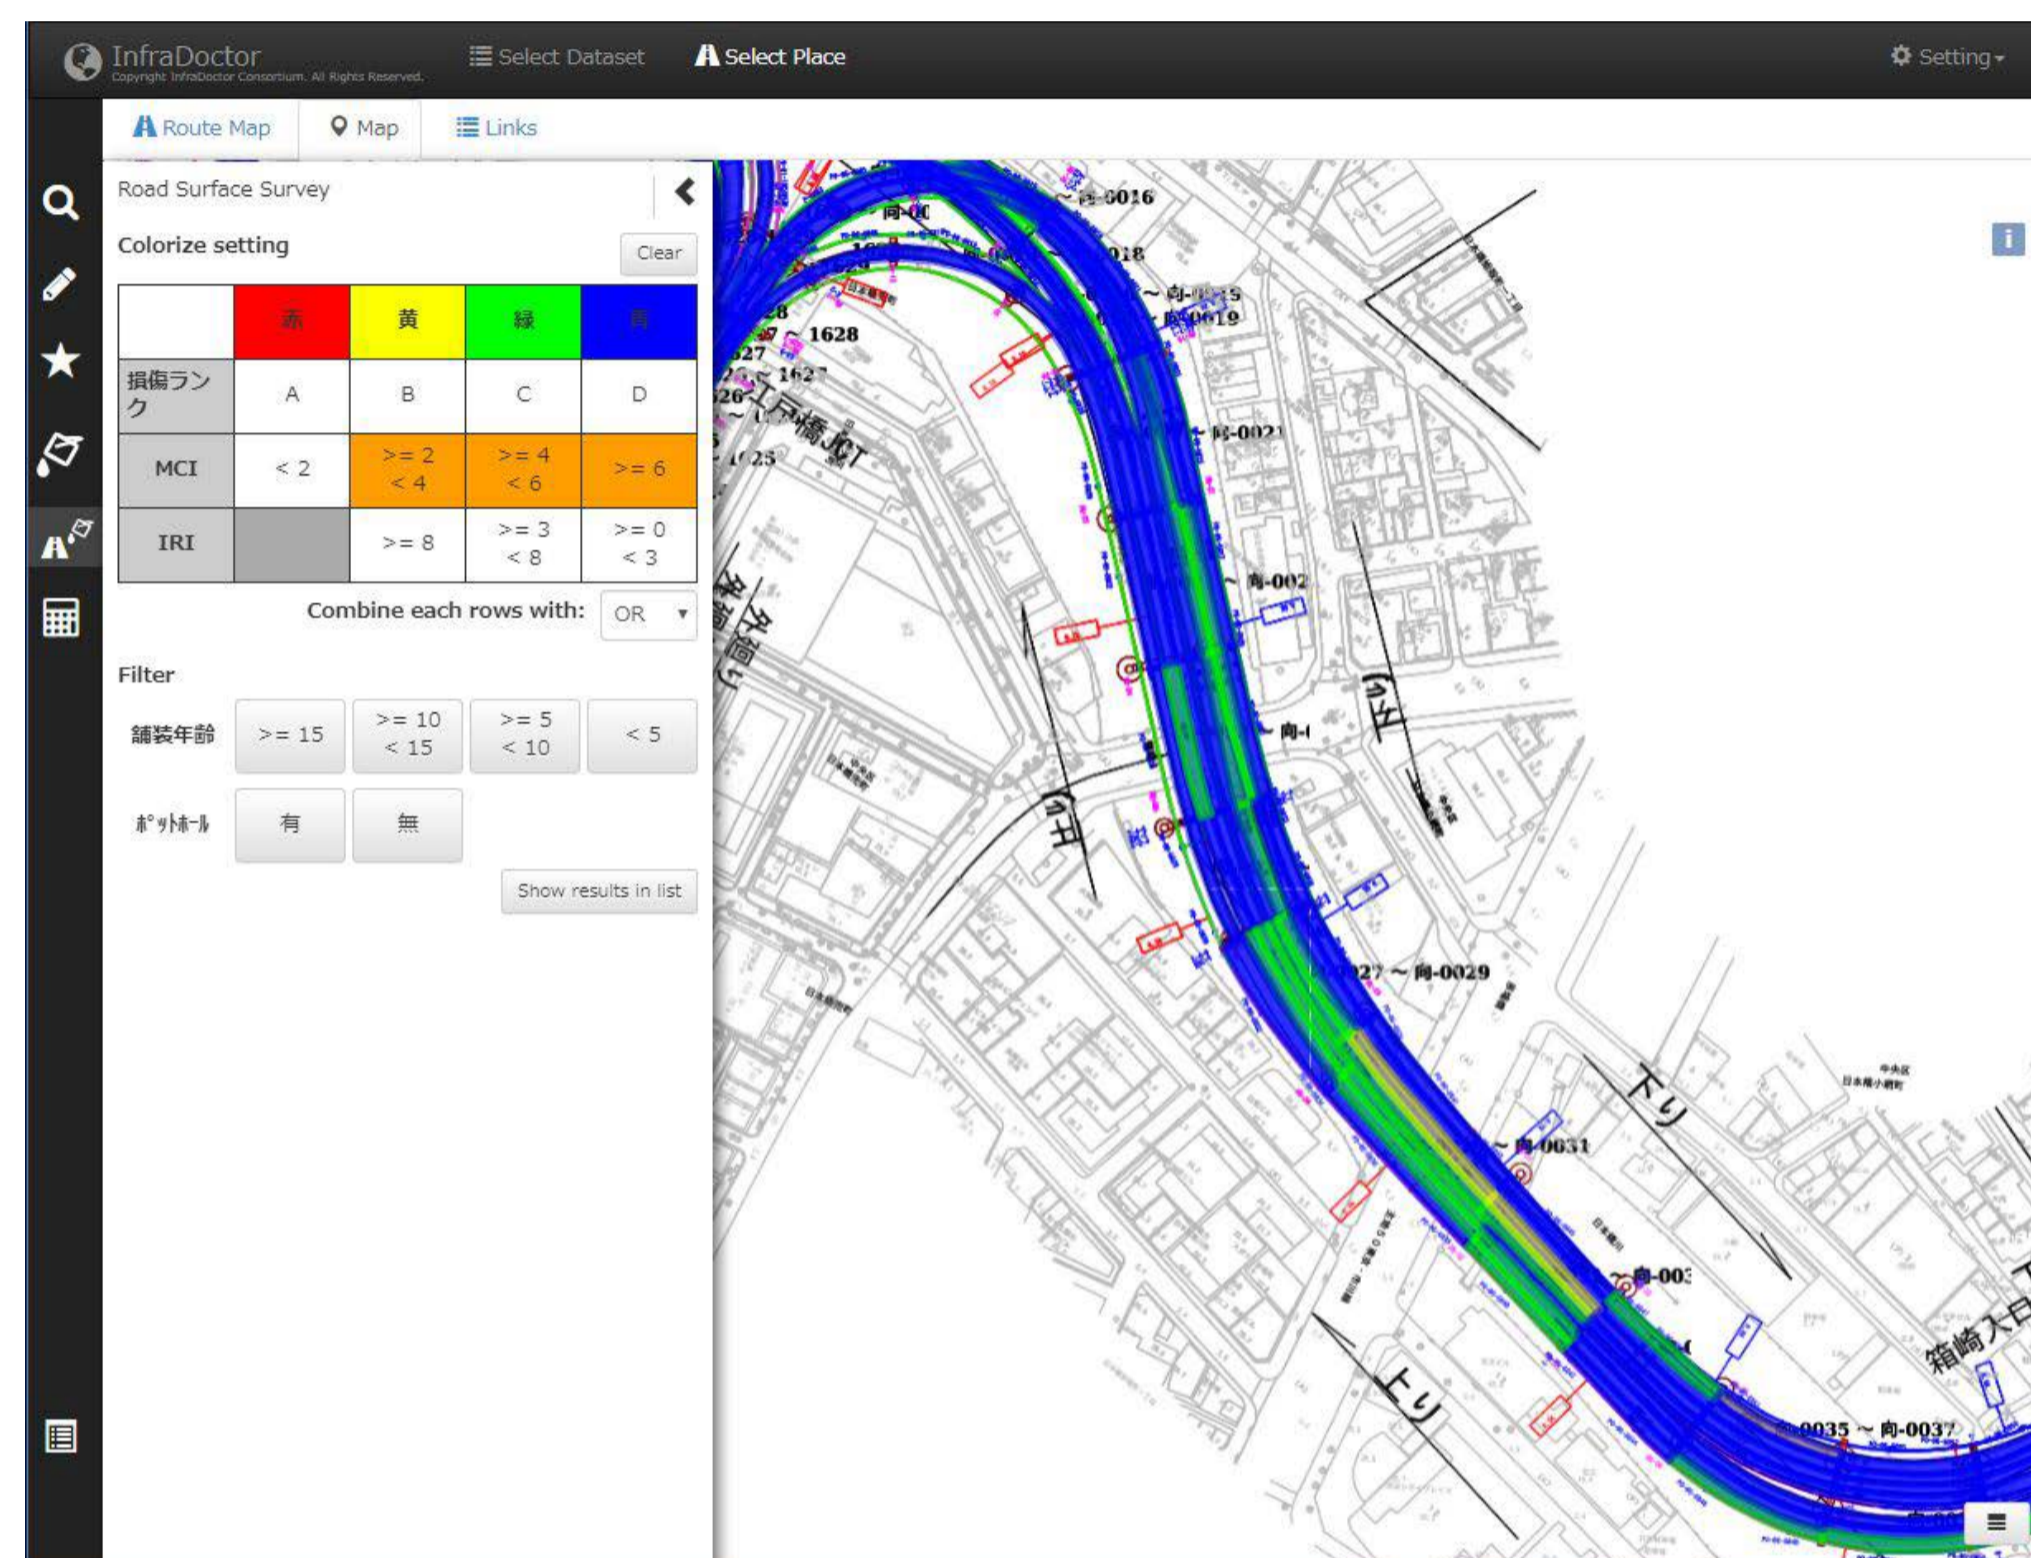

3D point cloud data are acquired by a Mobile Mapping System (MMS) vehicle, equipped with laser scanners and all-direction panoramic cameras.

3D dimension measurement

The 3D point cloud on a cloud server data has an accurate three-dimensional coordinate (X, Y, Z), allowing the measurement of any dimensions between two points while staying in work office.

Analysis of rutting and cracking rate on the pavement surface

Result of road pavement condition on GIS

InfraPatrol®

A system checking the daily road inspection work more efficiently and promptly, then confirming a damage on the road surface automatically

Feature

- Capturing the whole patrol process with moving pictures, which enable to the video later without re-run.
- The serious damage found by on-board visual inspection is immediately notified to the road administrator.

In order to be a safe and more relief road.
A revolutionary patrol inspection system that changes future road management work.

Ageing Road Assets

متقادم

Current situation and problem of expressways

- ◆ At least 40% of the total expressways-length has been operated for more than 30 years and because of this, the expressways are seriously deteriorated.
- ◆ At least 40% of the total bridge-length and 20% of total tunnel-length were also constructed more than 30 years ago and they are facing increased risk by the aged deterioration.
- ◆ The total vehicle weight is increasing with the increase in the number of large-scale vehicle on the expressways. The expressways are under severe conditions such as increasing in the usage of anti-freezing agent (NaCl) and the increase in the amount of extreme rainfall for a short time.

Severe environment in snow region

Concrete cracks and float

Concrete free lime

Damaged Condition

Expressway Renewal Project

التجديد

Severe deterioration on slab lower surface

Large-scale renovation for bridges

e.g. Replacement of RC concrete slab with PC precast slab

Open to Traffic (1963)

Deteriorated Structure (2014)

Undergoing Renewal Works (2019)

Renewed Segment (planned in 2026)

Expressway Inspection & Diagnosis

التفتيش والتشخيص

Road Surface

One of unique road surface inspection vehicles, not only can measure rutting, cracking, and flatness (σ_{10ft} , IRI) but also longitudinal and transverse pavement measurements without making contact with the pavement.

It can smoothly and safely perform all 6 functions at 100km/h without impacting the flow of other traffic.

High-Speed Road Surface Measuring Vehicle (Road Tiger)

Bridge

Digital camera/video camera system - Crack inspection:

High definition images taken by digital camera or video camera makes it possible to inspect the surface of a structure in the same way as the close visual inspection. Through a computer analysis of the images, the cracks are automatically detected.

Infrared Camera System – Delaminations /spill inspection:

The infrared camera system takes images which is analyzed automatically and displays the damage level in three stages. Because damages are objectively analyzed by software, bias or oversight in measuring caused by skill difference can be prevented. In addition, this system helps to create a research report since the detected results are easily captured on spreadsheets or word processing software. This system has gotten track records in the U.S.

Infrared thermal image

Bridge inspection using Infrared Camera System

Damage is detected by computer analysis

Tunnel Liner

Inspection vehicle

Filming in a tunnel

Crack analysis (minimum 0.2mm in width)

Tunnel liner inspection vehicle:

It is now possible to obtain a clearer image at a speed of 100km/h by adopting the line sensor camera instead of the conventional video camera. In addition, because the photographing illumination using LED infrared illumination is not visible to the naked eye, it no longer influences on the passing vehicles on the opposite direction. Moreover, this vehicle automatically identifies the cracks by the captured image.

Bridge inspection using Digital Camera System

Automatic crack-analysis by computer

Video Camera System

Disaster Management

الوقاية من الكوارث

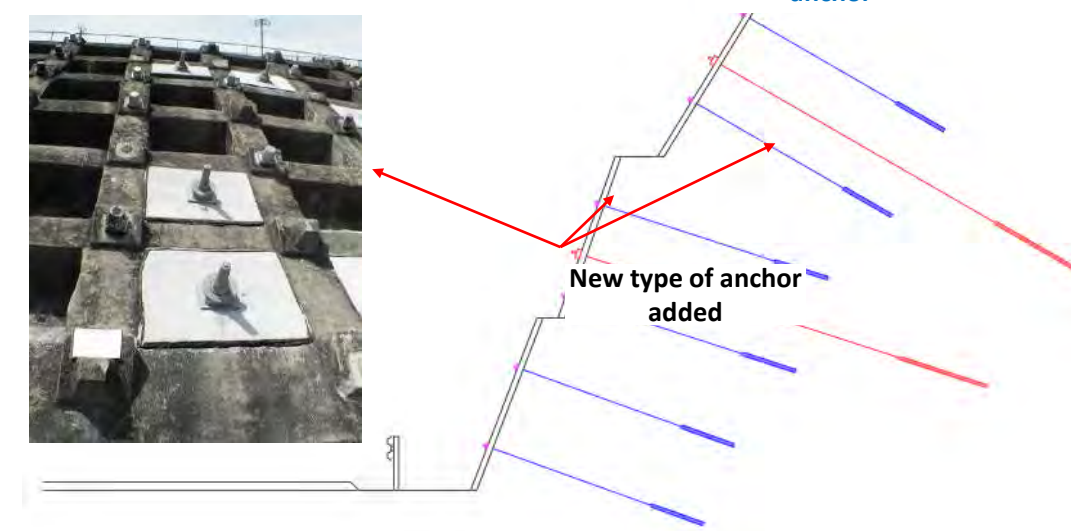

Disaster Prevention

Disaster caused by extreme rainfall for a short time

◆ Ground anchor

New type of anchor installation filling up traditional anchor with inadequate anticorrosion function

◆ Slope Protection Work

Measures against land slide

Use of rest areas as disaster-management bases

In the Great East Japan Earthquake, the Self-Defense Forces and firefighters heading to stricken areas used expressway rest areas as relay and support bases. Based on this experience and various issues, authorities are bolstering their disaster-response capabilities across Japan to respond effectively and efficiently to emergencies, using Moriya SA on the Joban Expressway as their model.

◆ Moriya Service Area (Southbound) on Joban Expressway, as a disaster management base

Disaster-response warehouse

Inflatable tents for outdoor use, emergency food and rations, relief supplies, traffic regulation equipment and other supplies are store at this Disaster-response warehouse

Emergency vehicle entrance/exit

Used by emergency vehicles to enter and exit outside of expressway in times of disaster

Generators and rooftop solar-power generation facilities

Solar-power generation panels on the roofs of commercial facilities

Generators enable continuous use for 72 hours

Heliport for mid-size Helicopters

Nighttime illumination and a helicopter office have been installed, enabling safe landing and take-off day and night

Well

A well has been dug in case of interruption of water supply

The food court is used as a disaster management office (1st Floor)

The food court layout can be rearrange for use as a disaster management office, under disaster situations

- Electrical power outlets and TV antenna terminals are installed
- Large monitors and whiteboards are installed

General situation

Emergency situation

First-aid space (2nd Floor)

The employee break lounge can be used as a first-aid

The recovery of the Tomei expressway in Makinohara area

Immediately after the Surugawan earthquake, NEXCO-Central started emergency checkup and stopgap recovery, and 4 days later, finished temporary recovery for general traffic.

Aug. 11th 2009

Aug. 15th 2009 (4 days later)

Earthquake Museum for educational assistance on disaster prevention

Great Hanshin-Awaji Earthquake occurred in January 1995, took precious lives and destroyed cherished livings of local communities. Earthquake Museum conveys how Hanshin Expressway responded in the 623 days to complete the restoration of the expressway system. It displays damaged structures and introduces new technologies and various activities which put into practice based on the lessons including disaster management support and educational assistance for disaster prevention.

Expressway Network in Japan

شبكة الطرق السريعة في اليابان

Japan's Expressways are built and operated by six companies.
The total length in operation is 10,351km, and 331 km is under construction.

Company Name:
West Nippon Expressway Company Limited
Head Office: Osaka
Expressways in Operation: 3,533km
Traffic Volume: 2.95million vehicles/day
Toll Revenue: US\$ 7.1billion
Expressway under construction: 72km

Company Name:
Hanshin Expressway Company Limited
Head Office: Osaka
Expressway in Operation: 250.4km
Traffic Volume: 0.72million vehicles/day
Toll Revenue: US\$ 1.7billion
Expressway under Construction: 34.2km

Company Name:
Honshu-shikoku Bridge Expressway Company Limited
Head Office: Kobe
Expressway in Operation: 172.9km
Traffic Volume: 0.12million vehicles/day
Toll Revenue: US\$ 0.6billion

Fukuoka

Sapporo

Sendai

Company Name:
East Nippon Expressway Company Limited
Head Office: Tokyo
Expressway in Operation: 3,943km
Traffic Volume: 2.95million vehicles/day
Toll Revenue: US\$ 7.82billion
Expressway under Construction: 75km

Company Name:
Central Nippon Expressway Company Limited
Head Office: Nagoya
Expressway in Operation: 2,132km
Traffic Volume: 1.98million vehicles/day
Toll Revenue: US\$ 6.30billion
Expressway under Construction: 132km

Company Name:
Metropolitan Expressway Company Limited
Head Office: Tokyo
Expressway in Operation: 320.1km
Traffic Volume: 1.02million vehicles/day
Toll Revenue: US\$ 2.4billion
Expressway under Construction: 17.5km

— In operation
- - - Under construction

As of JULY 1st, 2019

Note: Revenue is for year ended March 31, 2019 and calculated by the exchange rate of 110 JPY for 1 US\$
